Background

jQuery + Protovis \approx d3

- Any jQuery experience?
 - d3 is similar, but can also target the SVG (an xml-esque image format)
 - They both do some fancy functional programming to make it possible for us to declaratively (and efficiently) reach into the dom tree
- Any Protovis exposure by any chance?

  We have usb sticks
end
```

Canonical Test to Ensure Installation

- Navigate to an exercise file on your hard-drive in your browser
- Open up your browser's web developer tools
- Go to the developer tool console
- Enter d3 and you should see "object" in the response

Canonical Test to Ensure Installation

- Navigate to an exercise file on your hard-drive in your browser
- Open up your browser's web developer tools
- Go to the developer tool console
- Enter d3 and you should see "object" in the response

Canonical Test to Ensure Installation

- Navigate to an exercise file on your hard-drive in your browser
- Open up your browser's web developer tools
- Go to the developer tool console
- Enter d3 and you should see "object" in the response

Canonical Test to Ensure Installation

- Navigate to an exercise file on your hard-drive in your browser
- Open up your browser's web developer tools
- Go to the developer tool console
- Enter `d3` and you should see "object" in the response

Canonical Test to Ensure Installation

- Navigate to an exercise file on your hard-drive in your browser
- Open up your browser's web developer tools
- Go to the developer tool console
- Enter d3 and you should see "object" in the response

Canonical Test to Ensure Installation

- Navigate to an exercise file on your hard-drive in your browser
- Open up your browser's web developer tools
- Go to the developer tool console
- Enter d3 and you should see "object" in the response

Briefly playing in the console

- Navigate to <http://mbostock.github.com/d3/>
- Let's change the color of the hyperlinks
 - Open console
 - `d3.selectAll("a").style("color","red")`
 - `d3.selectAll("p").style("color","blue")`
- Note the existence of both `d3.select` and `d3.selectAll`
 - `d3.select` only chooses the first element

Exercise-01.html: Hello World

- This example only uses raw html (i.e. no SVG)
- Include the main d3 file in line 5
 - This, d3.js, is the 'core' module
 - The default build of d3.js includes the core, scale, svg and behavior modules
 - Others include:
 - d3.time.js
 - d3.geo.js
 - d3.csv.js

Exercise-01.html: Hello World

- All d3 commands live in a unified d3 namespace
- d3 supports CSS3 notation, i.e. one can select by:
 - Tag ("*div*")
 - Class ("*.awesome*")
 - Identifier ("*foo*")
 - Containment ("*parentchild*")
 - Intersection ("*.this.that*" for logical AND)
 - Union ("*.this, .that*" for logical OR)
 - Attribute ("*[color = red]*")
- Notice that method chaining has already begun
- Method chaining takes advantage of function that return the modified version of the incoming selection
- Elements can be accessed directly

(e.g. `selection[0][0]`)

Exercise-01.html: Hello World

- `.text()` is an "operator", a d3 term
- Operators can both get or set:
 - `.classed()` : toggling of css classes
 - `.style()` : sets the CSS style property (can be run w/ priority levels)
 - `.property()` : example, a slider value
 - `.property()` : example, a slider value
- By default, D3 supports `svg`, `xhtml`, `xlink`, `xml` and `xmlns` namespaces
- Additional namespaces can be registered

Exercise-01.html: Hello World

- Can be set as either constants or as functions
- When used to set document content, the operators return the current selection, so you can chain multiple operators together in a concise statement.
- `d3.select("")` \approx `$("")` \approx `jQuery("")`

Exercise-02.html:: Including an SVG Element

- Width and height could be related to the width and height of the window
- Think of the svg element as a canvas with a transformed coordinate system
- A svg:g element is means of containing other svg elements
- A tranform can be a handy way of moving the coordinate system to a desired location
- Regarding the coordinate system, note:
 - Origin is the top-left
 - x is positive to the right
 - y is positive down
 - scales can be used to correct to cartesian coords

Exercise-02.html:: Including an SVG Element

- `svg:circle` self explanatory
 - Refer to the SVG spec for relevant and/or required circle attributes
- Note the use of a JavaScript namespace variable to cache a selection of interest

Exercise-03.html: Combining with CSS Selections

- Concepts
 - CSS3 selector notation in the style section \approx in the `d3.select("")` command
 - Appending is fairly self-explanatory
 - Good practice to use intelligent id and class attributes

Exercise-03.html: Combining with CSS Selections

- Namespaces, explain that `svg:svg` ← first one is a namespace, second one is the element itself `svg:g` is kind of like a `div` in `html:...` just a bag in which to group other things in note: you give them uniqueness through class or id
- Attr, addressed in previous slide
- Appropriate use of namespace variables
- Assign a namespace at any "junction" in your workflow i.e. if you're about to add circles AND text to your scenegraph... it's probably appropriate to add a name to the state of your scenegraph at that point

Exercises-05.html through Exercise-08.html: Skipping for now

- d, i, and this
- Event listeners can take many forms
- Can listen for different types of events
- Click, mouseover, submit, etc.
- There's a subtlety of attaching to multiple functions to the same event...
- i.e. click.foo maps to one function, click.bar maps to another function

Exercises-05.html through Exercise-08.html: Skipping for now

- exercise-05.html: skip tweens and get to data bindings
- exercise-06.html: notice that we're scaling the whole image,
- exercise-07.html: listen to user events, i.e watch the mouse move
- exercise-08.html: mouse fading events
- exercise-09.html: html-based bar-chart to emphasize that it's not just for SVG canvases

Introduction
Background
Resources
Installation
Tutorials: Round One
A Quick Break
Tutorials: Round Two
Conclusion

A Quick Break

Exercise-09.html: Bar Chart

- Bar Chart with HTML Elements
- Scales

Exercise-09.html: Bar Chart

- Identity function
- Functional programming
- Data binding selections
- Update
- Enter
- Exit

Exercise-11.html: 2d Array into an HTML Table

- Foo

Exercise-12.html: 2d Array into SVG Bar Chart

- 2d Array into SVG Bar Chart
- RangeBands
- Linear vs. ordinal scales

Exercise-13.html: Axes Elements

Extras

- Transition \approx a non-instantaneous transformation with extra attributes:
 - Duration -
 - Delay -
- Ease
- Interpolate
- Tween (exercise-05.html if we get a chance)
- Call and each for control flow

Conclusion

- You rock for sticking through this duration
