# The Philosophy of d3

- d3 isn't just a charting library
- But, it does come with many examples and layouts
- d3 is small

# The Philosophy of d3

- d3 doesn't pollute the global namespace
- d3 honors and web standards instead of reinventing them
- Author exposure to modern web standards are portable
- d3 does "one" thing and does it well, reminiscent of the UNIX spirit

# d3 Solves the Cruxes of Visualization

- Binds data and styled presentation elements
  - Provides control over the ability to update, append and remove these bonds
- Provides scales to define the mapping back and forth between data and pixel space
  - These scales include linear, log, power, discrete/continuous, banded, ordinal, etc.

# d3 Solves the Cruxes of Visualization

- Obtain data anywhere by url (formats include text, json, xml, html, csv)
- Transitions between different style representations
- Targets the browser, making it ideal for quickly reaching a wide audience
  - And is there a story for getting to paper from there

# Background

- d3.js is loosely associated with the Stanford Visualization Group
- Supersedes the ProtoVis project, so resources found there can be relevant
- Mike Bostock is the primary author
- Open sourced on the highly active GitHub.com
- Only a year or two old

## Background, cont.

It largely targets the SVG element, which is being increasingly supported across all major browsers:

- Internet Explorer, 9+
- Chrome
- Firefox
- Safari
- iOS
- Android, 3.0+
- Opera, 9.5+

It should be noted that JavaScript has had huge investments in increasing its performance recently
